

When it comes to Multi-Axis Motion Control, why buy all of this?

When all you need is this.

Forget the extra spaghetti

And the feedback and control cables, PLCs, I/O blocks and cabinets. This smart plug-and-play servo motor has a drive, controller and encoder all in one little black box. So you save money and installation time.

More than “just a motor”

With our Combitronic™ technology, you can create motion control systems fast. Link 100+ SmartMotor™ servos over CAN to create a giant multi-axis controller – with no data collision or loss. And add additional axes in the field without parallel growth.

Don't settle for a stepper

Steppers are loud, power-hungry open-loop motors that can poll slip and lose position. SmartMotors are, well, smarter than that. And feature 24V I/O with interrupt trigger capability, lightning-fast program execution and advanced gearing, camming and contouring.

SmartMotors are tough, too

They're IP65/67 rated to withstand water, humidity, condensation, oil, dust, grease and food fights. Call us today to reduce costs and get your application up and running fast.
